Code walkthrough for the demo

Use this with `docs/demo-script.md`. All data is fake sample data. Paths are from the repository root. Line numbers are approximate and may drift as files change.

A. Short version (about 3 minutes, after step 11)

If time is short, open only these three files in this order.

Open this file	What to say
`backend/NbJewel.Api/Chat/ChatTools.cs`	The fixed read-only tools. The assistant can only call what is declared here. No free SQL. `RunAsync` (around line 93) runs a tool by name.
`backend/NbJewel.Api/Chat/Guards.cs`	The answer guards. `Guards.Run` (around line 41) runs them. Show `CheckSources` and `CheckNumbers`.
`backend/NbJewel.Api/Repositories/IItemRepository.cs`	The data layer interface (28 lines). Sample data now, SQL later, nothing else changes.

B. Chatbot backend (demo steps 8, 9, 10, 11)

Open this file	What to say
`backend/NbJewel.Api/Chat/ChatTools.cs`	Start here. Tool declarations and the dispatcher. Tied to `docs/tool-registry.md`.
`backend/NbJewel.Api/Chat/ChatOrchestrator.cs`	The flow: question, model, tool calls, parsed answer, guards. `AskAsync` is around line 30.
`backend/NbJewel.Api/Chat/Guards.cs`	Guards in order: tool calls made, sources valid, numbers valid, prompt not leaked. A refusal is safer than a wrong answer.
`backend/NbJewel.Api/Chat/SystemPrompt.cs`	The rules given to the model, including answering only from tool results (29 lines).
`backend/NbJewel.Api/Chat/GeminiLlmClient.cs`	The only place that calls Gemini over REST. The key and model come from environment variables (`GeminiOptions.FromConfiguration`), never from the repo or frontend.
`backend/NbJewel.Api/Controllers/ChatController.cs`	The HTTP entry point the Angular chat panel calls.

C. Swappable data layer (demo step 11, 'not done: SQL Server')

Open this file	What to say
`backend/NbJewel.Api/Repositories/IItemRepository.cs`	The contract.
`backend/NbJewel.Api/Repositories/SampleItemRepository.cs`	What runs now. Data lives in memory and resets on restart.
`backend/NbJewel.Api/Repositories/SqlItemRepository.cs`	The SQL option for later (see run-guide.md).

D. Frontend (demo steps 2 to 7 and 10)

Open this file	What to say
`frontend/src/app/features/catalog/catalog-list.component.ts`	The list, search and sort (steps 2 and 3).
`frontend/src/app/features/catalog/filters.component.ts`	The filters (step 3).
`frontend/src/app/features/catalog/item-detail.component.ts`	The item page with price and stock tabs (steps 4 to 7).
`frontend/src/app/features/catalog/item-tag.component.ts`	The printable tag with QR code (step 4).
`frontend/src/app/features/chat/chat-panel.component.ts`	The chat panel and the source chips (steps 8 to 10).
`frontend/src/app/features/chat/chat.service.ts`	Calls the .NET API. No Gemini key in the frontend.

E. Tests (optional close)

Open this file	What to say
`backend/NbJewel.Api.Tests/Chat/ChatGuardTests.cs`	Proves the guards accept good answers and reject bad ones.
`backend/NbJewel.Api.Tests/Chat/ChatToolsTests.cs`	Proves each tool returns the expected sample data.
